poly-maker backtest

Tape replay of the configured strategy over the last 45 days. Generated 2026-10-28 14:33 UTC. Three scenarios per market: **engine as-is** replicates the live engine's known defects; **fixed** has them corrected; **fixed + defenses** adds the inventory-lean floor and the bounded taker trade-out from the configured profile. Rewards are an estimate at an assumed 1% share of each market's daily pool.

Reading the table: **Trading PnL** is cash from fills plus inventory marked at the final mid, so it includes unrealized inventory risk. **Markout 5m** sums, over all fills, how far the mid moved for or against us five minutes after each fill; a negative number is adverse selection paid. **Scored** is the share of sampled minutes in which our resting quotes met the reward program's size and band rules on both sides (Qmin > 0). **Rewards** = daily pool x days x scored fraction x assumed share; see the sensitivity table on each market page.

Method and assumptions

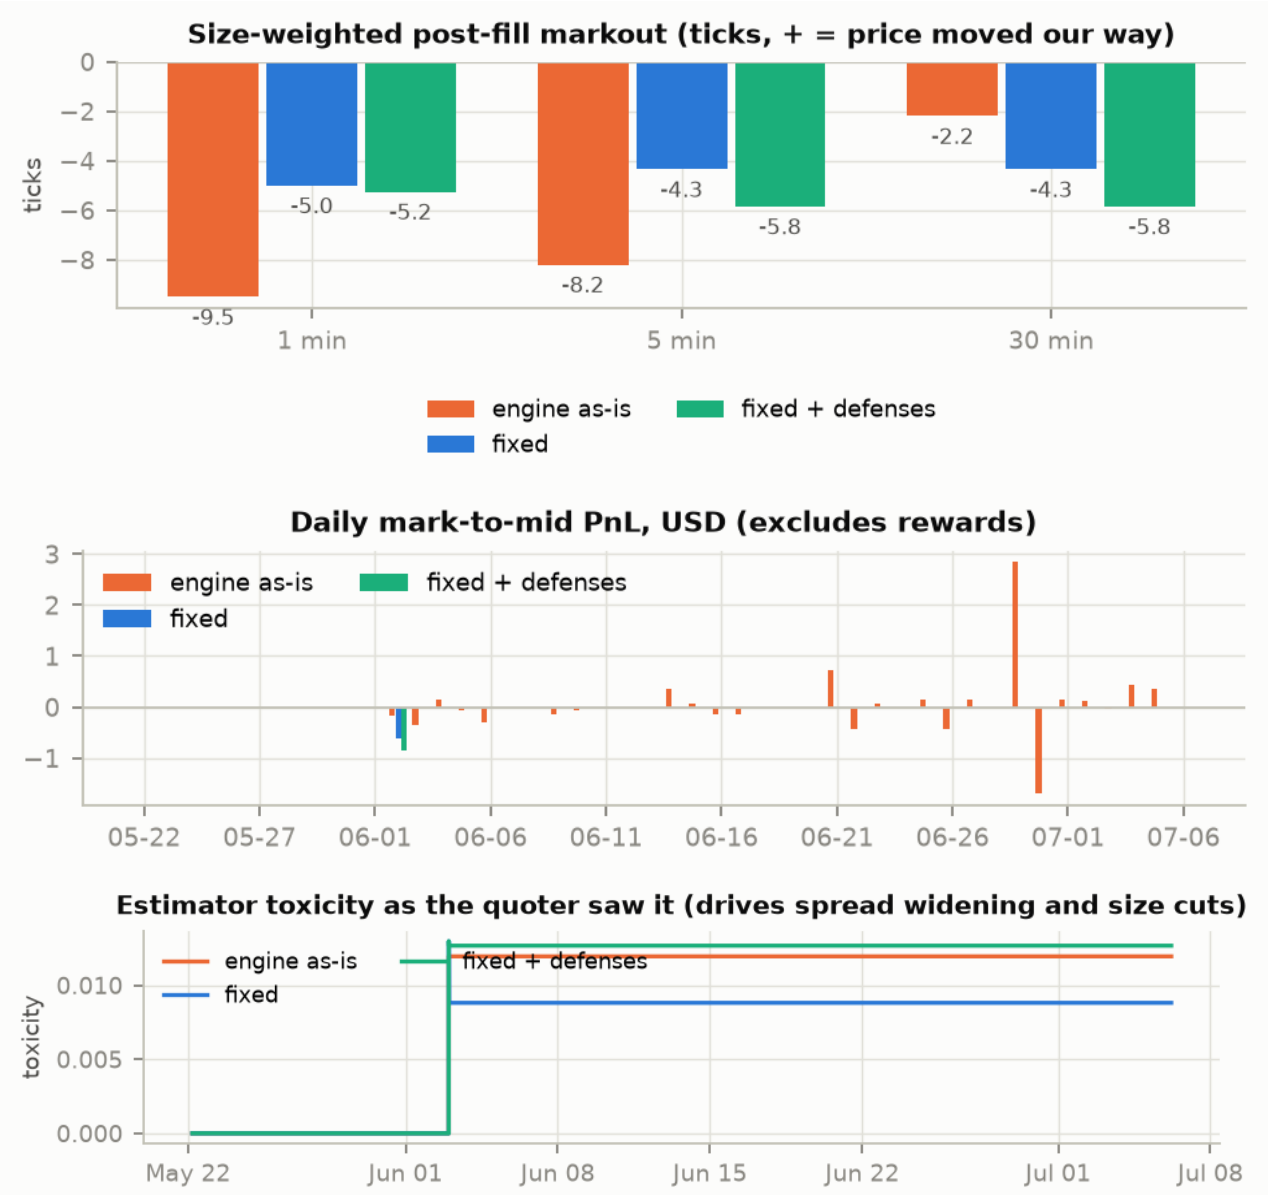

- **Strategy code under test is the repo's own pure core:** compute_fair_value, Vol/Flow/Markout estimators, RegimeMachine, construct_quotes, reconcile, RiskManager over a StateStore. The engine's I/O is replaced by the replay harness; nothing in strategy/ was modified for the backtest.
- **Data:** taker trade tape from poly_data on-chain fills (orderFilled.csv) and the CLOB /prices-history minute series for the YES token. Trades on the NO token are mapped to YES space (taker BUY NO at q = taker SELL YES at 1 - q). The on-chain tape holds every fill since V2 genesis, one print per taker order on the asset it traded (maker legs of the same match are not double counted).
- **Synthetic book:** no historical L2 exists, so best bid/ask = minute mid -/+ half the assumed spread (parameter spread_ticks) with a constant touch depth. Microprice = mid. Sub-minute book jitter, dust at the touch, and air pockets are therefore NOT modeled; the live regime machine will fire more often than this replay shows.
- **Fills (volume-ahead queue):** an order that joins or sits behind the touch starts with touch_depth shares ahead of it; prints at its level drain that queue before we fill; prints through the level fill us fully. Our presence is assumed not to change the tape (standard maker-backtest assumption; optimistic on thin markets).
- **Mint/merge matching is honored:** a taker SELL YES fills our BUY YES and our SELL NO exits; a taker BUY YES fills our SELL YES and our BUY NO. Pairs are marked at 1.00 total (merge not simulated; capital lock-up is reported, not penalized).
- **Rewards:** each minute we compute Q = S x ((v - s)/v)^2 per in-band order of at least the reward min size, Qmin = max(min(Qb, Qa/3), min(Qb/3, Qa)) for mids in [0.10, 0.90]. Competition is unobservable, so earned rewards = pool x scored fraction x an assumed share; three shares are shown per market.
- **Fees/rebates:** trade-outs pay the market's taker fee (rate x p x (1-p) per share); maker fills pay nothing and, on fee-enabled markets, are credited rebate_rate x the taker's fee (0 on fee-free markets such as politics).
- **Scenario 'engine as-is'** replicates: (1) markout recorded in token space against YES fair value, (2) raw aggressor sign on NO-token prints feeding the flow EWMA, (3) exit urgency never ramped. **'fixed'** corrects all three and runs the strategy core as it was before the defenses (every defense knob off). **'fixed + defenses'** runs the configured profile: inventory-lean floor, exits priced off the leaned reservation price, EVENT keeps exits alive, inventory measured as capital at risk, sub-minimum remnants replaced, and the bounded taker trade-out.
- **Toxicity memory:** an earlier candidate fix let adverse-selection toxicity age out over 30 minutes. Measured on both markets it re-engaged full size after every bad fill and roughly quadrupled the trading loss, so the shipped default keeps a long memory (no decay); the sensitivity table shows a 6-hour half-life for reference.
- **Risk:** the config's [risk] caps and daily-loss kill are active, reset at each UTC day boundary. Neg-risk group cost is zero (single markets).
- **Not modeled:** WS staleness, heartbeat gaps, post-only rejections, partial batch failures, data-API lag, gas or relayer costs, and competition reacting to our quotes.

Engine defects: measured cost

Two steps per market: the engine bug fixes (fixed minus as-is) and the defenses on top (defended minus fixed). Positive PnL/markout = the step helps; negative max-inventory and drawdown = less risk carried. The replay sees only minute mids and a synthetic book, so treat magnitudes as directional.

Caveats before acting on this

- A trades-only replay cannot see queue competition, dust at the touch, pulled liquidity, or gaps. On thin markets the live engine will be picked off more than shown here.
- The public tape under-reports flow (25-40% of Gamma's 24h volume on the run date), so expect more fills live than in this replay, in both directions.
- Rewards dominate the economics of both configured markets. The share assumption is the single largest uncertainty; measure it live by comparing paid rewards to the scored fraction over a few days.
- Window is one month of recent history. Re-run with --days and other markets before generalizing; the data cache makes re-runs offline.
- The trade-out is modeled as an immediate fill at the synthetic best bid for the capped size. Live, a FAK can fill partially or not at all when the bid has moved; the engine then waits out the cooldown rather than chasing.
- Remaining review findings not addressed by any scenario: the flow z-score bound (flow TRENDING trigger unreachable), the consecutive-recompute jump detector, own orders polluting the microprice, and the never-improve-the-touch placement rule.
